The air India breathes

26 cities · 2015 – mid-2020 · CPCB monitoring network

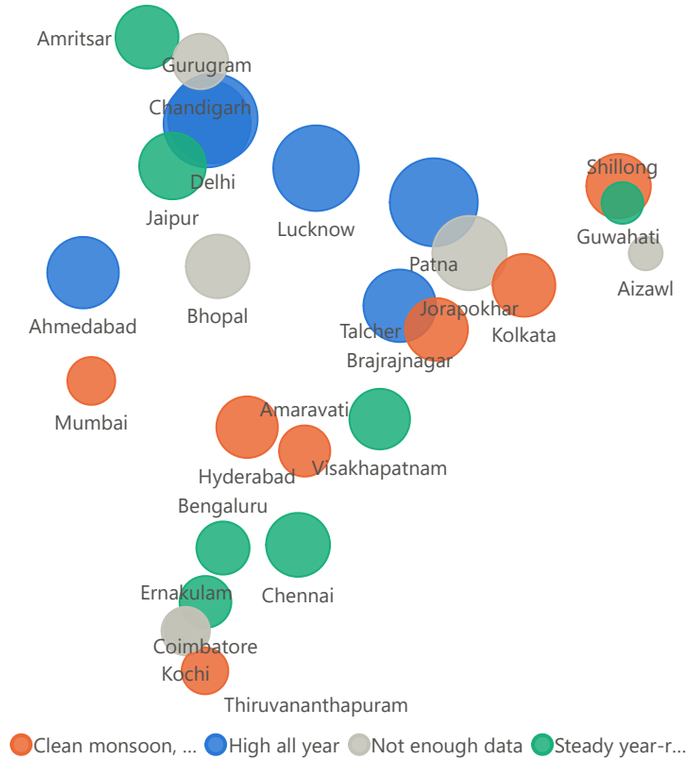

Overview | City explorer | Lockdown | Early warning | Data quality

Cities monitored	City-days with PM2.5 data	Typical PM2.5 (µg/m³)	Days above PM2.5 limit
26	25K	48	39%

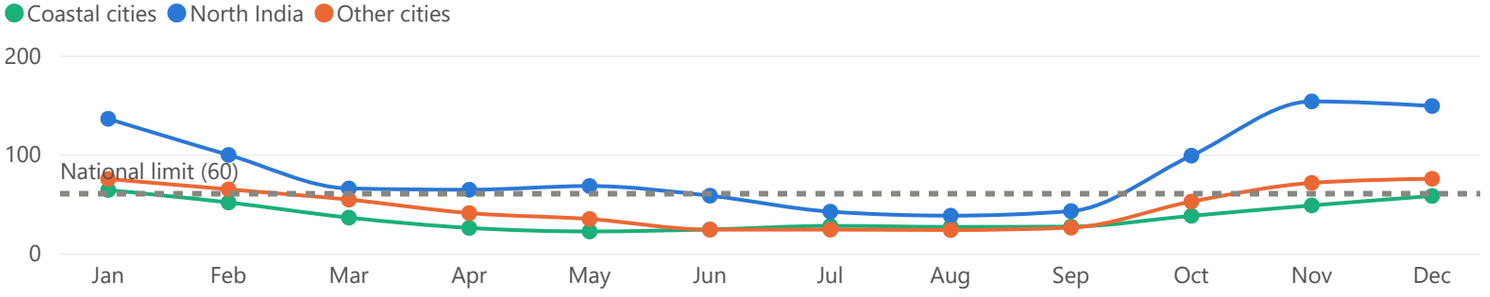

Year: All

Region: All

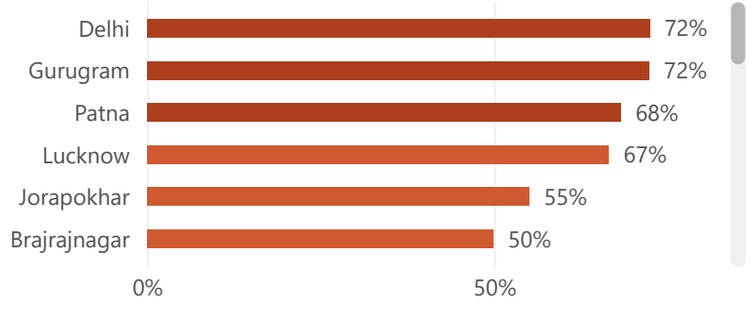

Where the air is worst (bubble = typical PM2.5)

North India's winter air is about 3x dirtier than its monsoon air

Delhi and Gurugram break the limit on 7 days in 10

What this page says

Across 26 cities, PM2.5 broke India's daily limit on **39% of measured days.**

The worst air is in the north (Delhi, Gurugram, Patna, Lucknow) and it peaks in **November–January**, when crop burning, cold still air and festival fireworks combine.

BREATHE INDIA

What the lockdown really changed

Actual pollution vs. what the weather alone would have produced

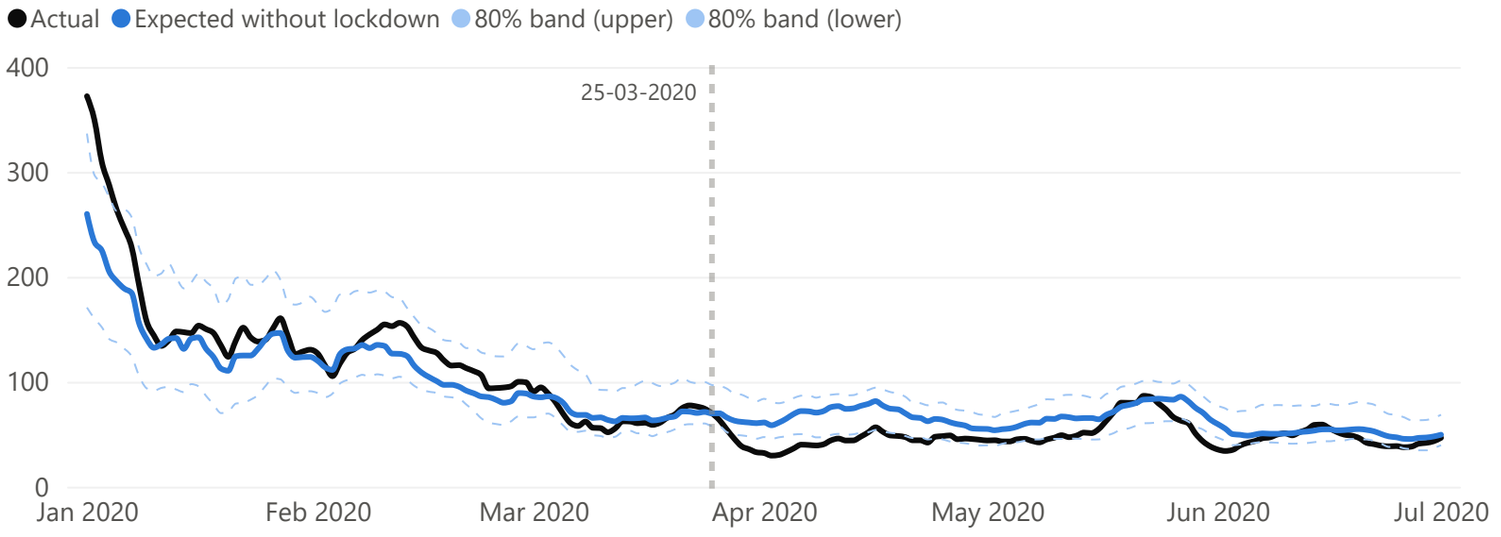

Overview | City explorer | **Lockdown** | Early warning | Data quality

PM2.5 vs 2019	PM2.5, weather removed	Drop due to weather	NO_2, weather removed
-44%	-28%	35%	-49%

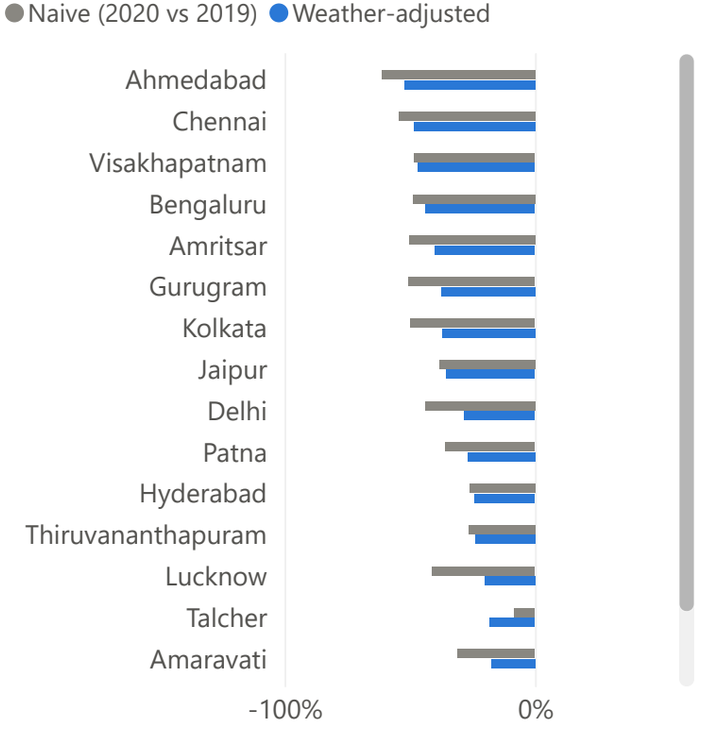

City: Delhi

Pollutant: PM25

Actual vs expected without lockdown, 2020 (pick a city and pollutant)

PM2.5 change by city: weather made most drops look bigger

Comparing spring 2020 with spring 2019 says PM2.5 fell **41%**. But spring 2020 also had kinder weather. Our model, trained on 2015–2019, predicts what pollution should have been given the actual weather. Against that, the real lockdown effect was **−28%**: about **a third of the headline drop was weather**. NO_2, mostly from traffic, fell **46%** either way.

BREATHE INDIA

Can we warn a day ahead?

Next-day AQI category model vs. a 'same as today' baseline

Model: exact category	Baseline ('same as today')	Poor-or-worse days caught	Right when the category changes
75%	72%	92%	35%

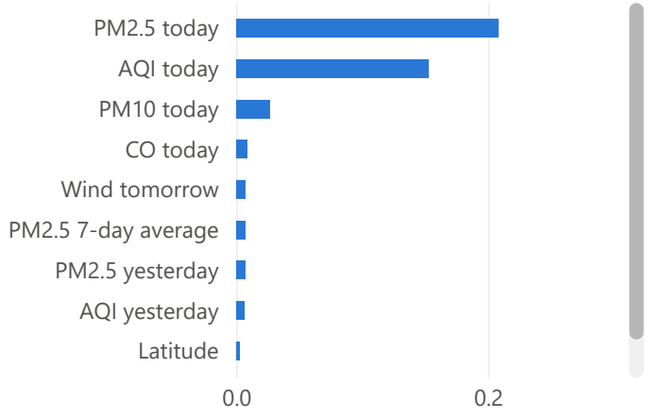

Evaluation period

Test

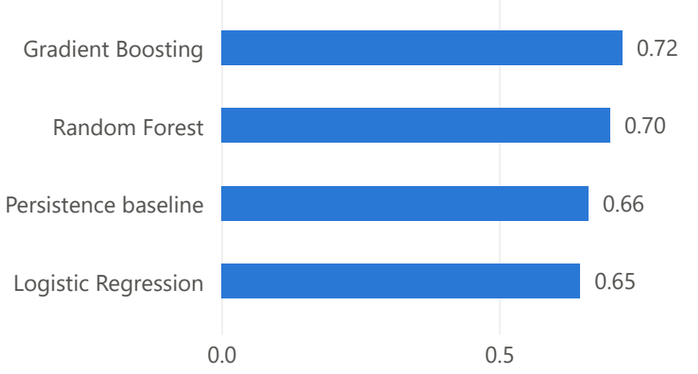

Where predictions land (row % of actual days, test period)

Actual	Good	Satisfactory	Moderate	Poor	Very Poor	Severe
Good	74%	26%	0%	0%	0%	0%
Satisfactory	9%	79%	12%	0%	0%	0%
Moderate	0%	15%	72%	12%	0%	0%
Poor	0%	0%	13%	76%	11%	0%
Very Poor	0%	0%	0%	20%	73%	6%
Severe	0%	0%	2%	1%	20%	77%

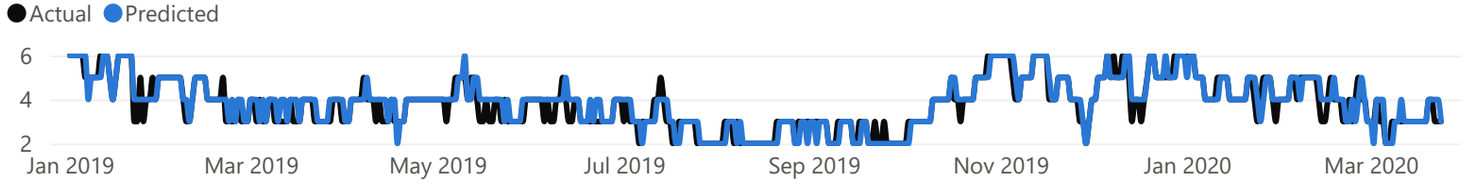

What the model relies on (top 10 inputs)

Macro F1 on unseen 2019–20 data: Gradient Boosting beats the baseline

Delhi: predicted vs actual AQI category (1 = Good … 6 = Severe)

The model gets **75%** of next-day categories exactly right (baseline 72%) and catches **92% of Poor-or-worse days** (baseline 80%).

Honest caveat: switch the period to Lockdown and it does worse than the baseline, because the rules it learned stopped applying.

How the data was cleaned

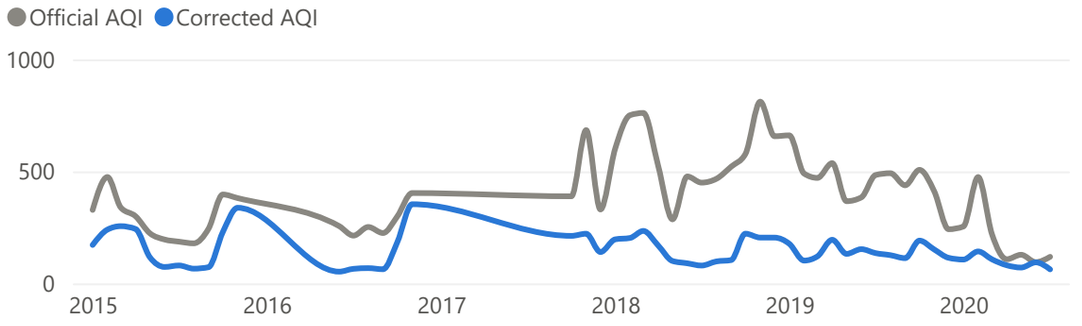

What we found, fixed and flagged before any analysis

Cleaning decisions logged	Days with bad PM data	AQI values rebuilt
23	408	3K

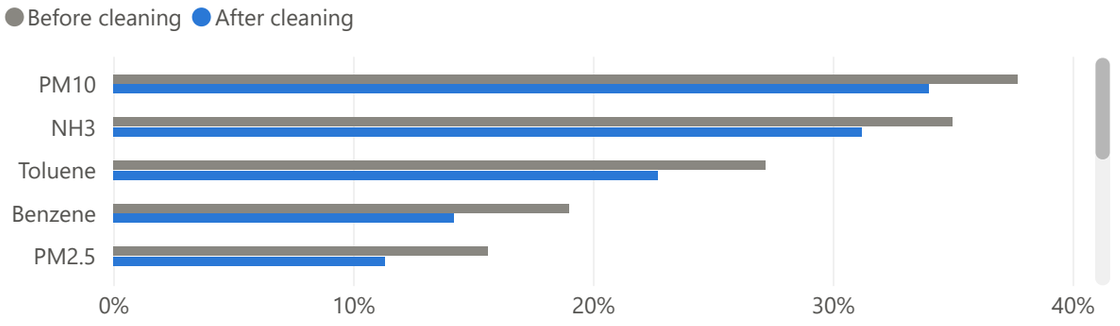

Ahmedabad: #1 most polluted → #7 after cleaning

Its CO sensor column was a copy of NO (identical on 94% of days).

Ahmedabad: official AQI vs corrected (monthly median)

Missing values before vs after cleaning

Cleaning log: every decision and why

#	Table	Issue found	Action	Reason
1	city_day	Date stored as text	Parsed to datetime with an explicit format (0 failures)	Needed for joins on date, lags and seasonal features
2	all	Possible duplicate rows or keys	Checked all tables; none found. Uniqueness is enforced again by the database keys	Keys must be unique for one-to-one joins
3	city_day	Ahmedabad CO equals NO on most days (r = 0.999) although units differ 1000x	Set all Ahmedabad CO values to missing and flagged the rows	Corrupted CO also inflates the official AQI; see the AQ
4	city_day	Exact 0.00 daily means for CO and NOx	Set to missing	A city-wide daily average of exactly zero is impossible
5	city_day	Exact zeros in Benzene / Toluene / Xylene	Kept as-is	Plausible 'below detection limit' readings, and these cc
